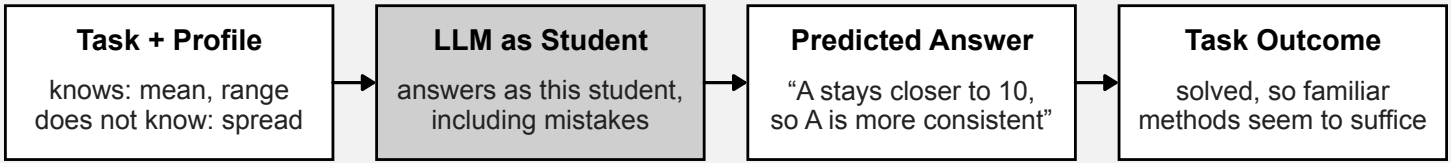
Same task for (a) and (b), illustrative:
Which player is more consistent? A: 4, 9, 10, 11, 16 B: 4, 8, 10, 12, 16 (both: mean 10, range 12)

(a) Simulated Student

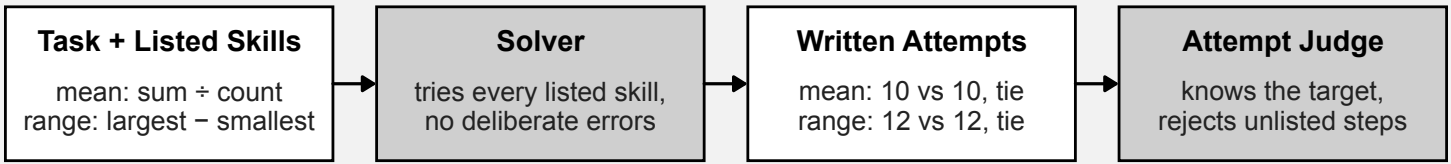
Asks the model to perform worse than it can



Problem: we cannot tell whether this is a student's invention or knowledge the model should have set aside.

(b) Prior-Knowledge Solver (Ours)

Asks the model to do its best with listed skills only



Result: both listed skills stop at a tie, so the judge finds that familiar methods fall short because spread is needed.
